

# SSH – Secure Shell

Week 6

# Cryptography

- **Plaintext** – Actual message
- **Ciphertext** – Encrypted message (unreadable gibberish)
- **Encryption** – Going from plaintext to ciphertext
- **Decryption** – Going from ciphertext to plaintext
- **Secret key**
  - Part of the mathematical function used to encrypt/decrypt.
  - Good key makes it hard to get back plaintext from ciphertext

Image Source: [gpgtools.org](http://gpgtools.org)

# Symmetric-key Encryption

- Same secret key used for encryption and decryption
- **Example** : Data Encryption Standard (**DES**)
- **Caesar's cipher**
  - Map the alphabet to a shifted version
    - ABCDEFGHIJKLMNOPQRSTUVWXYZ
    - DEFPGHIJKLMNOPQRSTUVWXYZABC
  - Plaintext – SECRET. Ciphertext – VHFUHW
  - Key is 3 (number of shifts of the alphabet)
- **Key distribution** is a problem
  - The secret key has to be delivered in a safe way to the recipient
  - Chance of key being compromised

# Public-key Encryption (Asymmetric)

- Uses a pair of keys for encryption
  - **Public key** – Published and known to everyone
  - **Private key** – Secret key known only to the owner
- **Encryption**
  - Use public key to encrypt messages
  - Anyone can encrypt message, but they cannot decrypt the ciphertext
- **Decryption**
  - Use private key to decrypt messages
- **Example : RSA** – Rivest, Shamir & Adleman
  - Property used - **Difficulty of factoring** large integers to prime numbers
  - $N = p * q$  (3233 = 61 \* 53)
  - N is a large integer and p, q are prime numbers
  - N is part of the public key
  - [http://en.wikipedia.org/wiki/RSA\\_Factoring\\_Challenge](http://en.wikipedia.org/wiki/RSA_Factoring_Challenge)

# Secure Shell (SSH)

- Telnet
  - Remote access
  - Not encrypted
  - Packet sniffers can intercept sensitive information (username/password)
- SSH
  - Run processes remotely
  - Encrypted session
  - **Session key** (secret key) used for encryption during the session

# Secure Shell (SSH) – Client Authentication

- **Password login**
  - `ssh username@ugrad.seas.ucla.edu`
- **Passwordless login with keys**
  - Use private/public keys for authentication
  - `ssh-keygen`
    - Passphrase (longer version of a password / more secure)
    - Passphrase for protecting the private key
    - Passphrase needed whenever the keys are accessed
  - `ssh-copy-id username@ugrad.seas.ucla.edu`
    - Copies the public key to the server (`~/.ssh/authorized_keys`)
  - Login without password
    - `ssh username@ugrad.seas.ucla.edu`
    - Run scripts/commands on the remote machine
      - `ssh username@ugrad.seas.ucla.edu ls`
    - But you need to provide the passphrase to use the private key

# Secure Shell (SSH) – Client Authentication

- Passphrase-less authentication
  - **ssh-agent** – Authentication agent
  - Manages private key identities for SSH
  - To avoid entering the passphrase whenever the key is used
  - **ssh-add**
    - Registers the private key with the agent
    - Passphrase asked only once
    - `ssh` will ask the `ssh-agent` whenever the private keys are needed

# Account Administration

- **Server**

- \$ sudo useradd -d /home/<username> -m <UserName>
- \$ sudo passwd <UserName>
- \$ cd /home/<username>
- \$ sudo mkdir .ssh
- \$ sudo chown -R <username> .ssh
- \$ sudo chmod 700 .ssh
- \$ ifconfig (This will give you the IP address of the server. Give this to your partner.)
- \$ ps aux | grep ssh (This should show a process named 'sshd' – the ssh daemon/server)

- **Client**

- \$ ssh-keygen
- \$ ping server\_ip\_addr (Just to check if the server responds)
- \$ ssh-copy-id -i <UserName>@server\_ip\_addr
- \$ ssh-add
- \$ ssh -X <UserName>@server\_ip\_addr
- \$ xterm
- \$ firefox

# X Session forwarding

- X is the windowing system for GUI apps on Linux
- You want to run such apps remotely, but the GUI should show up on the local machine
  - `ssh -X username@ugrad.seas.ucla.edu`
  - `gedit`
  - `gimp`

# Secure copy (scp)

- Based on Secure Shell (ssh)
- Used for transferring files between hosts in a secure way (encrypted)
- Usage similar to `cp`

- `scp [source] [destination]`

- Transferring to remote host

- `scp /home/username/doc.txt username@ugrad.seas.ucla.edu:/home/user/docs/`

- Transferring from remote host

- `scp username@ugrad.seas.ucla.edu:/home/user/docs/foo.txt /home/username`

# Digital Signature

- Protect **integrity** of the documents
  - Receiver received the document that the sender intended
- Digital signature is extra data attached to the document that can be used to check **tampering**
- **Message digest**
  - **Shorter** version of the document
  - Generated using **hashing** algorithms
  - Even a slight change in the original document will change the message digest with **high probability**

# Digital Signature

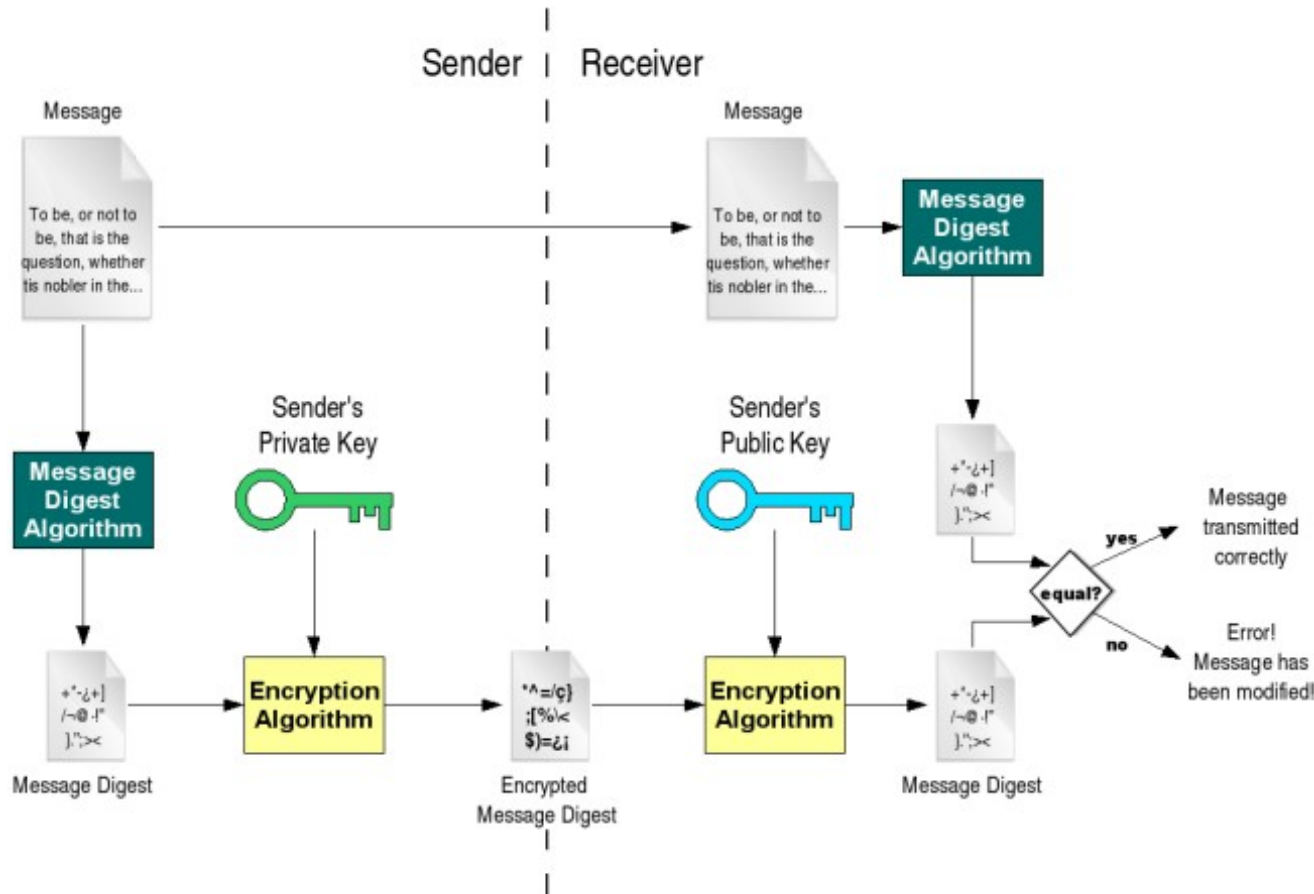

Image Source : gdp.globus.org

- Verifies document integrity
- Does it prove origin?

# GNU Privacy Guard

- `gpg [option]`
  - `--gen-key` (Generating new keys)
  - `--armor` (ASCII format)
  - `--export` (Exporting public key)
  - `--import` (Import public key)
  - `--detach-sign` (Creates a file with just the signature)
  - `--verify` (Verify signature with a public key)
  - `--encrypt` (Encrypt document)
  - `--decrypt` (Decrypt document)
  - `--list-keys` (List all keys in the keyring)
  - `--send-keys` (Register key with a public server / `--keyserver` option)
  - `--search-keys` (Search for a someone's key)
